### Kinetic Characteristics
Tenofovir alafenamide (TAF) is a prodrug of tenofovir. Tenofovir alafenamide 25 mg provides enhanced delivery of tenofovir to lymphatic tissues, resulting in ~5-fold higher tenofovir diphosphate concentrations in peripheral blood mononuclear cells and ~90% lower circulating tenofovir compared to tenofovir disoproxil 300 mg.

The kinetics of single dose TAF 25 mg was assessed in 14 subjects with severe renal impairment (eGFR 15-29 mL/min) and 13 controls (eGFR ≥90 mL/min). TAF exposures were moderately higher (92% increase AUCinf and 83% increase in Cmax) in severe renal impairment compared to controls. Less than 1% of TAF was eliminated in urine. Tenofovir AUCinf and Cmax were 5.8-fold and 2.8-fold higher, respectively in severe renal impairment compared to controls.¹

The kinetics of single dose TAF 25 mg was assessed in subjects with stable mild (Child-Pugh A) or moderate (Child-Pugh B) hepatic impairment versus healthy controls. In subjects with mild hepatic impairment, TAF AUC decreased 7% and Cmax decreased 11% and tenofovir AUC decreased 11% and Cmax decreased 3% compared to controls. In subjects with moderate hepatic impairment, TAF AUC increased 13% and Cmax increased 19% and tenofovir AUC decreased 3% and Cmax decreased 12% compared to controls. These changes are not considered clinically relevant.²

### Atazanavir
When TAF 10 mg/emtricitabine 200 mg was coadministered with atazanavir 300/ritonavir 100 mg once daily, TAF AUC increased 91%, Cmax increased 77% and tenofovir AUC increased 162% and Cmax increased 112%, compared to TAF 10 mg/emtricitabine 200 mg administered alone. Atazanavir pharmacokinetics were not significantly altered in the presence of TAF/emtricitabine.³

Use tenofovir alafenamide 10 mg with boosted PIs.

### Darunavir
When TAF 10 mg/emtricitabine 200 mg was coadministered with darunavir 800/ritonavir 100 mg once daily, TAF AUC increased 5%, Cmax increased 42% and tenofovir AUC increased 105% and Cmax increased 142%, compared to TAF 10 mg/emtricitabine 200 mg administered alone. Darunavir pharmacokinetics were not significantly altered in the presence of TAF/emtricitabine.³

Use tenofovir alafenamide 10 mg with boosted PIs.

### Dolutegravir
When TAF 10 mg/emtricitabine 200 mg was coadministered with dolutegravir 50 mg once daily, TAF AUC increased 18%, Use tenofovir alafenamide 25 mg
